Jeppiaar SRR Engineering College

### PROJECT EXPERIENCE

#### FinTech – Security Analysis Module

##### Technology Used:

Java, Neo4j, React, Traversal-Framework, Neo4j-harness

##### Job Role:

Software Developer

#### Roles & Responsibilities

- Designed and implemented RESTful APIs to meet project requirements and specifications
- Developed comprehensive unit test suites using Neo4j harness framework to validate API functionality and behavior.
- Conducted thorough code reviews of team members' code changes to ensure adherence to coding standards, maintainability, and scalability.

**Description:**

The development of the bespoke project involves the analysis of securities for hedging, put, call, roll forward, long, short, wash sale, straddle, and other purposes. Data is converted from a zip file that is received to a CSV file. Neo4J and Java manage the entire calculation process.

**Order Management System****Technology Stack:**

Java, React, Spring Boot, MySQL, Hibernate, Kafka

**Job Role:**

Software Developer

**Roles & Responsibilities**

- Ensured adherence to industry best practices and standards for API development, including proper authentication, error handling, and documentation.
- Collaborated with QA team to incorporate automated testing into the CI/CD pipeline for continuous validation of code changes.
- Engaged in discussions with team members to resolve code-related issues and address technical challenges effectively

**Description:**

It's an Order Management System developed for the Manufacturing Industry. Orders are received through SAP and synced with this middleware application. Orders go through various stages during production. All the information is captured in detail during the production stage. Once production is completed, the output information is sent back to SAP for further processing
